12.2 Persistence and degradability

In a fresh water microcosm study, ¹⁴C-azocyclotin was observed to be rapidly hydrolyzed to cyhexatin, which in turn was mineralized to ¹⁴CO₂(1).

12.3 Bioaccumulative potential

An estimated BCF of 2,400 was calculated for azocyclotin(SRC), using a log Kow of 5.3(1) and a regression-derived equation(2). According to a classification scheme(3), this BCF suggests the potential for bioconcentration in aquatic organisms is very high(SRC).

12.4 Mobility in soil

The Koc of azocyclotin is estimated as 18,000(SRC), using a log Kow of 5.3(1) and a regression-derived equation(2). According to a classification scheme(3), this estimated Koc value suggests that azocyclotin is expected to be immobile in soil. The pKa of azocyclotin is 5.36(1), indicating that this compound will partially exist in the protonated form in the environment and cations generally adsorb to organic carbon and clay more strongly than their neutral counterparts(4).

12.5 Other adverse effects

no data available

SECTION 13: Disposal considerations

13.1 Disposal methods

Product

The material can be disposed of by removal to a licensed chemical destruction plant or by controlled incineration with flue gas scrubbing. Do not contaminate water, foodstuffs, feed or seed by storage or disposal. Do not discharge to sewer systems.

Contaminated packaging

Containers can be triply rinsed (or equivalent) and offered for recycling or reconditioning. Alternatively, the packaging can be punctured to make it unusable for other purposes and then be disposed of in a sanitary landfill. Controlled incineration with flue gas scrubbing is possible for combustible packaging materials.
